

KOMATSU

Another Schwank Success Story

Installation details: A high bay building of single skin construction boasting an average thermal conductance of $4.4 \text{ W/m}^2/\text{°C}$. The incumbent heating system relied upon 300 HTHW unit heaters via two uncontrollable boilers. The system failed to provide satisfactory comfort levels and resulted in fuel bills in excess of £300,000 p.a. The installation of 329 Schwank Supra radiant plaque heaters reduced heating costs by 60%, an influencing factor when the company received a GEM Award.
